Introduction
Parents in medical school face unique challenges and situations that require consideration by undergraduate medical education faculties. Student-parents include, but are not limited to, biological and adoptive parents, expectant parents, foster parents, co-parents, step-parents and legal guardians of all genders. Parenting while studying medicine is an ambitious, but increasingly common, endeavour (Gradstein, 2008). Student-parents have roles and responsibilities which often compete for time and attention, and as a result they may require special resources or accommodations. To date, the CFMS has not officially addressed this issue; as such, there is a need for a comprehensive policy position. An urgent call has been put forward in Canada, and internationally, for institutions to develop formal parental policies to support medical students at all levels of training and ensure their well-being and success (Task Force on the Accommodation of the Pregnant Physician, 2010; Cujec et al., 2000; Gradstein, 2008; Nagata-Kobayashi et al., 2007; Taylor et al., 2013).

For medical students, undergraduate medical education may coincide with pregnancy, parenthood, and guardianship; for some, it directly coincides with childbearing years. Entrance into most Canadian medical schools requires a minimum of three years of undergraduate studies, with the exception of Quebec; accordingly, many medical students are 26 years or older at the time of graduation (The Association of Faculties of Medicine of Canada, 2011). The number of women graduating from medical school has also increased over the past 45 years, from 17% in 1970 to 59% in 2005 (Gradstein, 2008). Additionally, unforeseen events may also result in a medical student’s short or long-term guardianship of a child. Regardless of how students enter the role of parenthood or guardianship, whether entry into the role is planned and achieved through pregnancy or adoption or due to other circumstances, student-parents’ dual responsibilities must be respected and supported by Canadian medical schools.

Many aspects of undergraduate medical education pose particular challenges for student-parents. Sleep deprivation, irregular and unpredictable work hours leading to difficult child-care arrangements, time-intensive and challenging workloads, and a lack of flexibility from the curriculum significantly impact parents of any gender, in any family arrangements (Finch 2003). Conflict due to the competing demands of parenthood and the undergraduate medical curriculum may deeply impact the physical and mental wellness of student-parents. Accordingly, it is important for the CFMS to support student-parents and advocate on their behalf for comprehensive policies at Canadian medical schools.

Current Policies for Parental Leave in Canada Undergraduate Medical Education
The attached table in the Appendix summarizes current policies and information regarding parental leave and accommodation policies at Canadian medical schools as of April 2017. A comprehensive search of publicly available Canadian medical school websites and student handbooks was conducted in addition to email correspondence with each medical school’s Student Affairs office regarding any additional resources or accommodations not included in the publicly available written policies. The search results suggest that current parental accommodation policies at Canadian medical schools are inconsistent and sometimes difficult for students to find and navigate. These barriers to information may render the decision-making process for both prospective and current medical students considering parenthood much more
difficult.

There are several elements that a comprehensive parental leave policy should include, which extend from current Canadian medical school policies. These include: the start and duration of pregnancy and parental leave, the eligibility of taking parental leave for biological and adoptive parents, and the impact of absence on graduation. At present, parental leave policies across Canadian medical schools address some, but not all, of these elements.

There are variable supports, accommodations and information provided by each medical school. Most schools allow for a leave of absence of up to 12 months, allowing for the student to graduate with the subsequent class. However, parental leave lengths varied greatly, with some schools providing no written policy regarding the length of parental leaves offered. Some Canadian medical schools provide financial support for student-parents taking a leave of absence during which their financial aid is suspended. For example, Quebec students on Aide financière aux études may be eligible for the loan repayment postponement program; and, University of Ottawa provide emergency funds that student-parents may apply for while on leave. Western and Queen’s University support their student-parents by giving them priority day-care spots on campus. Accommodations provided for pregnant students and student-parents include on-call restrictions, provision of breastfeeding / pump rooms (McGill provides breastfeeding rooms in all major teaching sites including rural settings), and preference of clerkship sites and the flexibility of rotations peri-partum. Furthermore, schools such as McMaster University also have explicit written policies supporting the safety of pregnant-students during their clinical rotations.

It is important to note that most Canadian medical schools stated either through correspondence or through publicly available written policies that current student-parents and students considering parenthood should individually consult with the offices of Student Affairs. Many schools may provide accommodations, supports or individualized leaves of absences based on the personal circumstances of the student outside of their formal written policies.

**Parenting & Medical Student Wellness**

The CFMS is committed to promoting medical student wellness. Burnout is an ongoing concern in medical schools and student-parents may be at an increased risk due to higher levels of stress. Burnout can be described as physical, mental and emotional exhaustion caused by stress, and can result in decreased motivation, enthusiasm, and efficiency at the task at hand. It is distinct from clinical depression, although the former can convert into the latter (Meldrum, 2010). In a study of 2536 Canadian physicians, workload was shown to be related to cynicism and exhaustion, both of which are strong contributors to burnout (Leiter et al., 2009). Medical student-parents may have to contend with dual workloads: that of school, exams and clinical responsibilities, and that of their dependents and home life, thus competing for a student’s time, attention and cognitive space.

While seeking mental health services is protective and supportive of mental wellness (OMSA, 2015), students often report lack of time as a barrier to accessing mental health services (Givens & Tijia, 2002). Students with the dual role of parenting may face additional barriers to accessing support as they may have less flexible or more demanding schedules. Along with the regular stressors of family life, there is often unpredictability and inflexibility in the student’s schedule.
causing constraints on personal time, which poses an additional challenge as they try to balance both student and family responsibilities (Lovell et al., 2009).

In medical school, many students experience symptoms of burnout resulting from the fast-paced curriculum, intensity of the work, and extracurricular involvement (OMSA, 2015; Tepper et al., 2015). One study viewed burnout as a more prevalent consequence as students adjust to their pre-clerkship responsibilities (Mazurkiewicz et al., 2012). A 2008 study analysing female physicians and work-life balance noted that participants felt pressure to choose between family and career (Mobilos et al., 2008). Similar choices between family and perceived pressure to take on extracurricular and research duties exists for student-parents of all genders. Another study, which looked at barriers to wellbeing in Canadian physicians, identified family responsibilities as a major source of stress (Lovell et al., 2009). Many physicians may feel as though the stresses of both environments force them to prioritize one over the other. For these reasons, student-parents appear to be at a particularly high risk of burn-out. It is important for medical professionals to have a sense of awareness of burnout, its signs, and short/long-term consequences.

Despite the increased stress which can accompany the dual roles of physician and parent, this combination can also bring about increased well-being to physicians. In an analysis of physician strategies for avoiding burnout, spending time with loved ones is shown to be a very efficacious method for decreasing work-induced exhaustion (Meldrum, 2010). In terms of specific strategies for maintaining an effective work-life balance, a study at the Mayo Clinic outlined a number of key characteristics, including: flexible scheduling, a culture supporting personal health and well-being, and a culture endorsing a life outside of work (Shanafelt et al., 2008). All of these strategies are family centered and would benefit medical student-parents. Thus, while parenting in medical school poses challenges, it can be a great source of resiliency, particularly if adequate supports are available to overcome the unique challenges faced by parents.

**Principles**

The CFMS endorses the following principles in support of all student-parents in the undergraduate medical education program:

1. All people in Canada deserve equitable access to appropriate health care, including: support during pregnancy and the peri-partum period; breastfeeding support; and support for all parents and guardians inclusively.
2. Medical learning and performance is directly influenced by the health of the learner. Healthy learners will become healthy physicians who can improve the health of communities.
3. Medical students have the right to a safe and healthy learning environment, including: accommodations appropriate during pregnancy and/or breastfeeding; and other accommodations which may be required by any parent or guardian.
4. Medical students should have access to advice and support from their faculties in addressing personal health and wellness, including pregnancy, postpartum, breastfeeding, the adoption process, and parenting support.
5. Medical students who are pregnant, breastfeeding, in the adoption process, and/or parenting should be supported by their peers and preceptors.
Recommendations

1. Increase and improve accessibility of undergraduate medical education to student parents through curricular flexibility, greater transparency, and improved facilities

Accessibility of undergraduate medical education is important for student-parents to better integrate their academic pursuits with their roles as parents. This includes: (a) increased flexibility in the UME curriculum; (b) greater accessibility and transparency regarding parental leave policies; and (c) access to certain accommodations (such as breastfeeding/pumping facilities).

A) Increased curricular flexibility

Flexibility in curriculum and in scheduling is integral to developing a supportive school environment for student-parents. The typical undergraduate medical education curriculum, however, is rigid both in terms of schedules and timeframes for completion. Historically, Canadian medical trainees have shown the greatest need for schedule flexibility due to family reasons during medical school compared to other stages of training (Cujec et al., 2000). The Federation of Medical Women of Canada (FMWC) conducted a needs assessment in 2008; they found that female students prioritized having flexibility in and control over their schedules, calling for “improved opportunities for different styles of education” which may involve part-time training and improved exit or re-entry strategies (Gartke & Dollin, 2010).

Curricular flexibility can be achieved, as demonstrated by other universities. For example, the Warren Alpert School of Medicine at Brown University adopted a flexible pre-clerkship curriculum made up of discrete 6 week courses. This allows students to take 6 weeks of leave at various points in the curriculum and then later make them up, eliminating the need to take an entire year off and guaranteeing all new parents a minimum of 6 weeks off (Taylor et al., 2013).

The main concern for medical students considering a parental leave of absence is whether they can complete their training within the regular three or four-year curriculum (Taylor et al., 2013). Recommendations have been made in the literature for medical schools to adopt flexible schedules, allowing student parents to complete requirements for CaRMS and graduation without taking a formal leave of absence (Taylor et al., 2013; Task Force on the Accommodation of the Pregnant Physician, 2010). The CFMS similarly advocates that medical schools improve and increase the accessibility of the undergraduate medical education curriculum for student parents.

Some supportive practices already in place at some Canadian schools include recorded lectures and seminars that allow students to study from home. Another such practice includes the longitudinal clerkship experience, where students follow patients in their experience through the various facets of the healthcare system longitudinally, rather than during a predetermined set of weeks. Without the strict timeline and structure of the core specialty blocks, the longitudinal clerkship experience may allow for more flexibility and greater control over one’s schedule. Policies like these, however, are not uniform across the country and experiences may vary. Accordingly, the CFMS recommends the strengthening and integration of such practices in addition to the development of further curricular flexibility for parents and future-parents.
Additionally, greater inclusivity and transparency regarding absence policies specific to family needs can be of a great support to student-parents. Policies that specifically allow for absences and/or early excusals from mandatory learning activities when it concerns a child’s health or education can promote learner wellness and create a family-centred, supportive learning environment for student-parents.

B) Greater transparency regarding parental leave policies

Each medical school in Canada should clearly outline parental leave options in an accessible manner for current and prospective students (i.e., in a publicly accessible student handbook or website). This information is important not only for current or expectant parents, but also for any student who may be considering parenthood at any time throughout their medical school training. Clearly outlining available accommodations has been found to send a positive messages to female students whose future may include motherhood (Task Force on the Accommodation of the Pregnant Physician, 2010). Similarly, it can be anticipated that such policies would foster inclusivity to all students considering pregnancy or parenthood. Further promotion of accommodations also allows for students to make informed decisions when visiting other medical schools through electives.

C) Increased access to resources and facilities

An additional aspect of parenting includes the right to breastfeed and/or express breastmilk. Such policies are necessary to ensure a student is provided with protected time and adequate facilities to breastfeed or express breastmilk. This is especially important during clerkship rotations, where students may feel uncomfortable asking preceptors for time and space to express breastmilk. Lack of support for breastfeeding has been identified as a “significant gap” in undergraduate and graduate level policies (Gradstein, 2008). Advocacy for increased and improved accessibility of the undergraduate medical education curriculum to student parents can include the call for policies which promote, encourage and protect the right to breastfeed and express breastmilk. Such policies are a feasible way to demonstrate committed support to student-parents (Taylor et al., 2013).

2. Foster a strong, supportive and family-friendly environment for its student-parents through peer support and mentorship.

While written policy is the first step in actively supporting student parents, it is also necessary to create a supportive culture (Task Force on the Accommodation of the Pregnant Physician, 2010). Medical schools and student associations like the CFMS must actively work to foster a positive environment which supports, encourages, and celebrates student-parents. The level of support and understanding from medical schools in Ontario is considered poor (Gradstein, 2008).

The CFMS advocates for the development, participation, and promotion of networks that support and encourage student-parents. The FMWC has identified the need for positive role models and mentors for student-mothers (Gartke & Dollin, 2010). Another advocacy group, MomDocFamily
in the United States, has recommended that all medical schools initiate a systematic network of faculty physicians to “support, advise and mentor medical student parents, especially mothers” (Taylor et al., 2013). These mentors may help student-parents and pregnant medical students with disclosures, establishing boundaries with patients and colleagues, dealing with the dual-role and stress involved with simultaneous medical training and child-rearing, and other personal and professional issues (Taylor et al., 2013; MacNamara et al., 2012). The benefits of this mentorship program include reduced isolation for student-mothers, professional networking opportunities, and practical tips and advice for parenting (MacNamara et al., 2012). Similar benefits can be anticipated for mentorship opportunities for student-parents more broadly.

Student-parents bring a unique perspective and valuable personal and educational contributions to the classroom (Taylor et al., 2013). An environment that is strongly supportive of their role as both a student and a parent can have an important impact in enabling them to thrive in both of these aspects of their lives. In addition to advocating that undergraduate medical faculties promote having such a supportive environment, the CFMS should itself also promote a strong supportive environment for student-parents through, for example, the creation of peer-support networks. Under the leadership of the National and Local Officers of Sexual and Reproductive Health, a national student-parent network can be developed to support current parents and medical students considering parenthood as a peer-to-peer resource.

3. The provision of special considerations to medical students during clerkship, including when visiting other universities for elective placements and residency interviews.

Student-parents may also face specific difficulties during clerkship as placements can be variable and geographically diverse. Student-parents might be less flexible in terms of geographical location of clerkship placements. Special accommodations for student-parents regarding clerkship placement sites can help ease the dual responsibilities student-parents face to their family and their schooling.

Furthermore, for student-parents visiting other universities on electives, we recommend greater transparency and accessibility to accommodations provided by the host school, including access to breastfeeding facilities, duty-hour limits, and flexibility in scheduling.

Additionally, we recommend that student-parents should be considered for special accommodations for the residency interview process. Some student-parents might be unable to travel or to be away from home on a given day; greater flexibility regarding distance-interviews, including the use of phone and video devices, as well as greater flexibility in timing, can make the process more accessible.

Lastly, each medical school should clearly communicate a strong policy supporting the rights of pregnant students regarding accommodations and the right to refuse work that may harm their pregnancy or their health. Such policies should be regularly communicated to faculty, clerks and elective students.

|                             | • U of T Family Care Office has resources, events, seminars, groups for students with children (not medicine specific).                         |                                                                                      |
|                             | • Listserv for student-parents in UME being set up (not yet ready).                                                                     |                                                                                      |
| University of Western Ontario| • Students encouraged to take full year of pregnancy/parental leave during pre-clerkship and clerkship studies with re-entry into curriculum where they left off. | • Online policy ‘Leave of Absence – Maternity/Paternity’
|                             | • Preference of clerkship sites (close to home) is not the norm.                                                                         | • Individual consultation with Student affairs office and MD program staff.            |
• Clerkship students (year 3 and 4) may take up to 4 weeks of pregnancy/parental leave with no delay in graduation date if clinical duties missed during the 4 weeks are made up.

Accommodations
• Learner Equity and Wellness Services states it ‘provides progressive support services for students and residents, acknowledging the need for special arrangements to be made during the educational program for the purpose of pregnancy and parental leave’.
• *Small private meeting room with locked door in Learner Equity and Wellness Services can be used for breastfeeding.*
• Western students have priority with campus daycare facilities.
• Accommodations can be made upon request for students who may require flexibility during clerkship due to childcare responsibilities (i.e. locations not requiring overnight or long commute).

• Western UME ‘Pregnancy and Parental Leave’ policy, last revised 2014

### University of Calgary (Cumming School of Medicine)

**Parental Leave**
- Maternity leave for up to 1 year, paternity leave up to 6 months. In preclerkship years, students returning from parental leave will be scheduled to join beginning of next respective class or at beginning of the relevant course.
- Year 3 medical students leaving for longer than 2 weeks will meet with Program Supervisor to develop proposed scheduled plan for return (based on availability of rotation).

**Accommodations**
- *Accommodations are provided on a case-by-case basis.*
- University of Calgary UME ‘Leave of Absence/Time Away (Medical Students)’ policy, last revised 2016
- Individual consultation with the Assistant Dean, UME or designate.

### University of British Columbia

**Parental Leave**
- Maximum duration of leave granted to students for the birth or adoption of a child is typically 1 year up to a maximum of 2 years. More than 4 weeks of absence will require a formal parental leave of absence and will usually delay graduation (less than 4 weeks’ absence will not).
- Leave of absence must be approved by the site Regional Associate Dean (RAD) or site Assistant Dean, MD Undergraduate Education as designate. The student and the curricular faculty and the Office of Student affairs generate a tentative leave plan indicating the dates, duration, learning activities that will be missed and how the students plans to meet the learning objectives for those activities.

**Accommodations**
- *Students work directly with Student Affairs Deans to accommodate on an individual basis.*
- University of British Columbia Undergraduate Medical Education, ‘Policy and Procedure’, last reviewed 2015
- Individual meeting with site Associate/Assistant Dean and/or Office of Student Affairs.
